

Maintenance

CLEANING AND CARE

By their very nature, our metal ceilings require little maintenance. Nevertheless, various types of cleaning methods can be used:

- To remove dust, use a soft brush or vacuum cleaner with a non-abrasive nozzle.
- To remove pencil or similar marks, simply use an eraser.
- In case of grease stains, use a cloth slightly dampened with a surfactant, taking care not to get the insulation material wet.
- For other stains or dirty marks, use a damp cloth or sponge, taking care not to get the insulation material wet.

Never use abrasive products.

When using chemicals, always test on a concealed part of the ceiling.

Contact us before using disinfectant solutions.

PAINTING A CEILING

You can paint a metal ceiling if it is not perforated or does not contain an acoustic fleece. In all cases, use suitable, high-quality products. However, painting the ceiling will invalidate its fire resistance rating, light reflection performance and indoor air quality rating (IAQ).
